# Problem Statement

**X Education is an online course-selling company. They have collected potential leads through various channels. But at present their lead conversion rate is roughly 30% which is very low and the business is spending lots of money on lead follow-ups. We need to create a machine-learning solution that will increase the lead conversion rate by identifying potential and non-potential leads. This will save the company money on lead follow-up activities and potentially give the business an understanding of the profile of a lead who might purchase a course from X Education.**

# Data Analysis

Our dataset contains 9240 data points each with 36 features

Data columns (total 37 columns):

#	Column	Non-Null Count	Dtype
0	Prospect ID	9240 non-null	object
1	Lead Number	9240 non-null	int64
2	Lead Origin	9240 non-null	object
3	Lead Source	9204 non-null	object
4	Do Not Email	9240 non-null	object
5	Do Not Call	9240 non-null	object
6	Converted	9240 non-null	int64
7	TotalVisits	9103 non-null	float64
8	Total Time Spent on Website	9240 non-null	int64
9	Page Views Per Visit	9103 non-null	float64
10	Last Activity	9137 non-null	object
11	Country	6779 non-null	object
12	Specialization	7802 non-null	object
13	How did you hear about X Education	7033 non-null	object
14	What is your current occupation	6550 non-null	object

# Data Analysis

Most of the features are categorical values

	Lead Number	Converted	TotalVisits	Total Time Spent on Website	Page Views Per Visit	Asymmetrique Activity Score	Asymmetrique Profile Score
count	9240.000000	9240.000000	9103.000000	9240.000000	9103.000000	5022.000000	5022.000000
mean	617188.435606	0.385390	3.445238	487.698268	2.362820	14.306252	16.344883

max	660737.000000	1.000000	251.000000	2272.000000	55.000000	18.000000	20.000000

# Data Analysis

**Removed unwanted features and features with ~0 variance**

**> Project ID, Lead Number**

**> Do not call, What matters most to you when choosing a course, Magazine, Newspaper Articles, X Education Forums, Newspaper, Digital Advertisement, Through Recommendations, Receive More updates about our courses, Update me on supply chain content, Get updates on dm content, I agree to pay the amount through cheque, Search**

# Data Analysis

- > Many categorical columns has labels with very less percentage of occurrence**
- > Grouped those items to single category to avoid large number of dummy variables**

# Data Analysis

> Country has majority items in India. Grouped all other countries together

Country	
India	70.259740
United States	0.746753
United Arab Emirates	0.573593
Singapore	0.259740
Saudi Arabia	0.227273
United Kingdom	0.162338
Australia	0.140693
Qatar	0.108225
Hong Kong	0.075758
Bahrain	0.075758
Oman	0.064935
France	0.064935

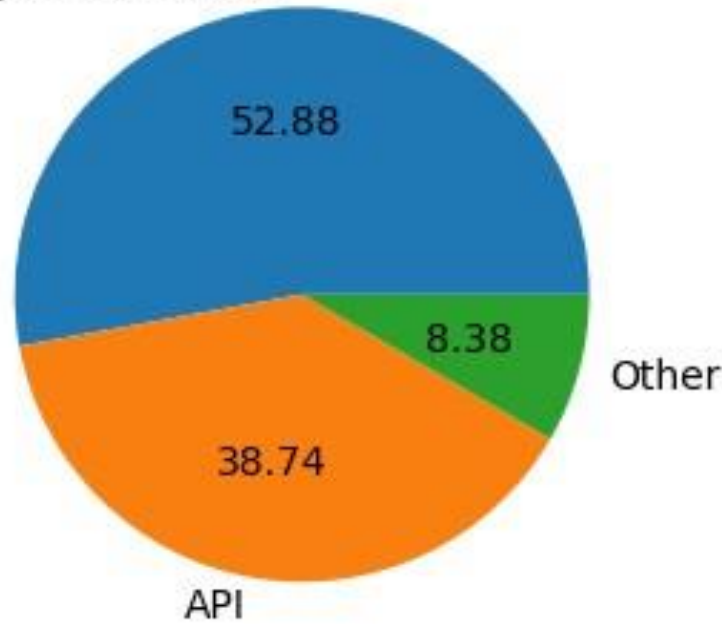

# Data Analysis

- > Columns with more than 40% null values are dropped**
- > Other null values are imputed with central tendency measures**
- > In case of 'City', since it can be grouped with country we used central tendency measures of each group.**
- > We could identify that even though country is not India, many cities are assigned as Mumbai. This should be further analysed on the user input side.**

Last Notable Activity

# Data Analysis

**Most Total Visits are under 5 and is continuously decreasing**

# Data Analysis

**Most students spend <500min on site and is continuously decreasing**

# Data Analysis

**Most students view only less than 2 pages and this variable does not have a linear pattern**

# Data Analysis

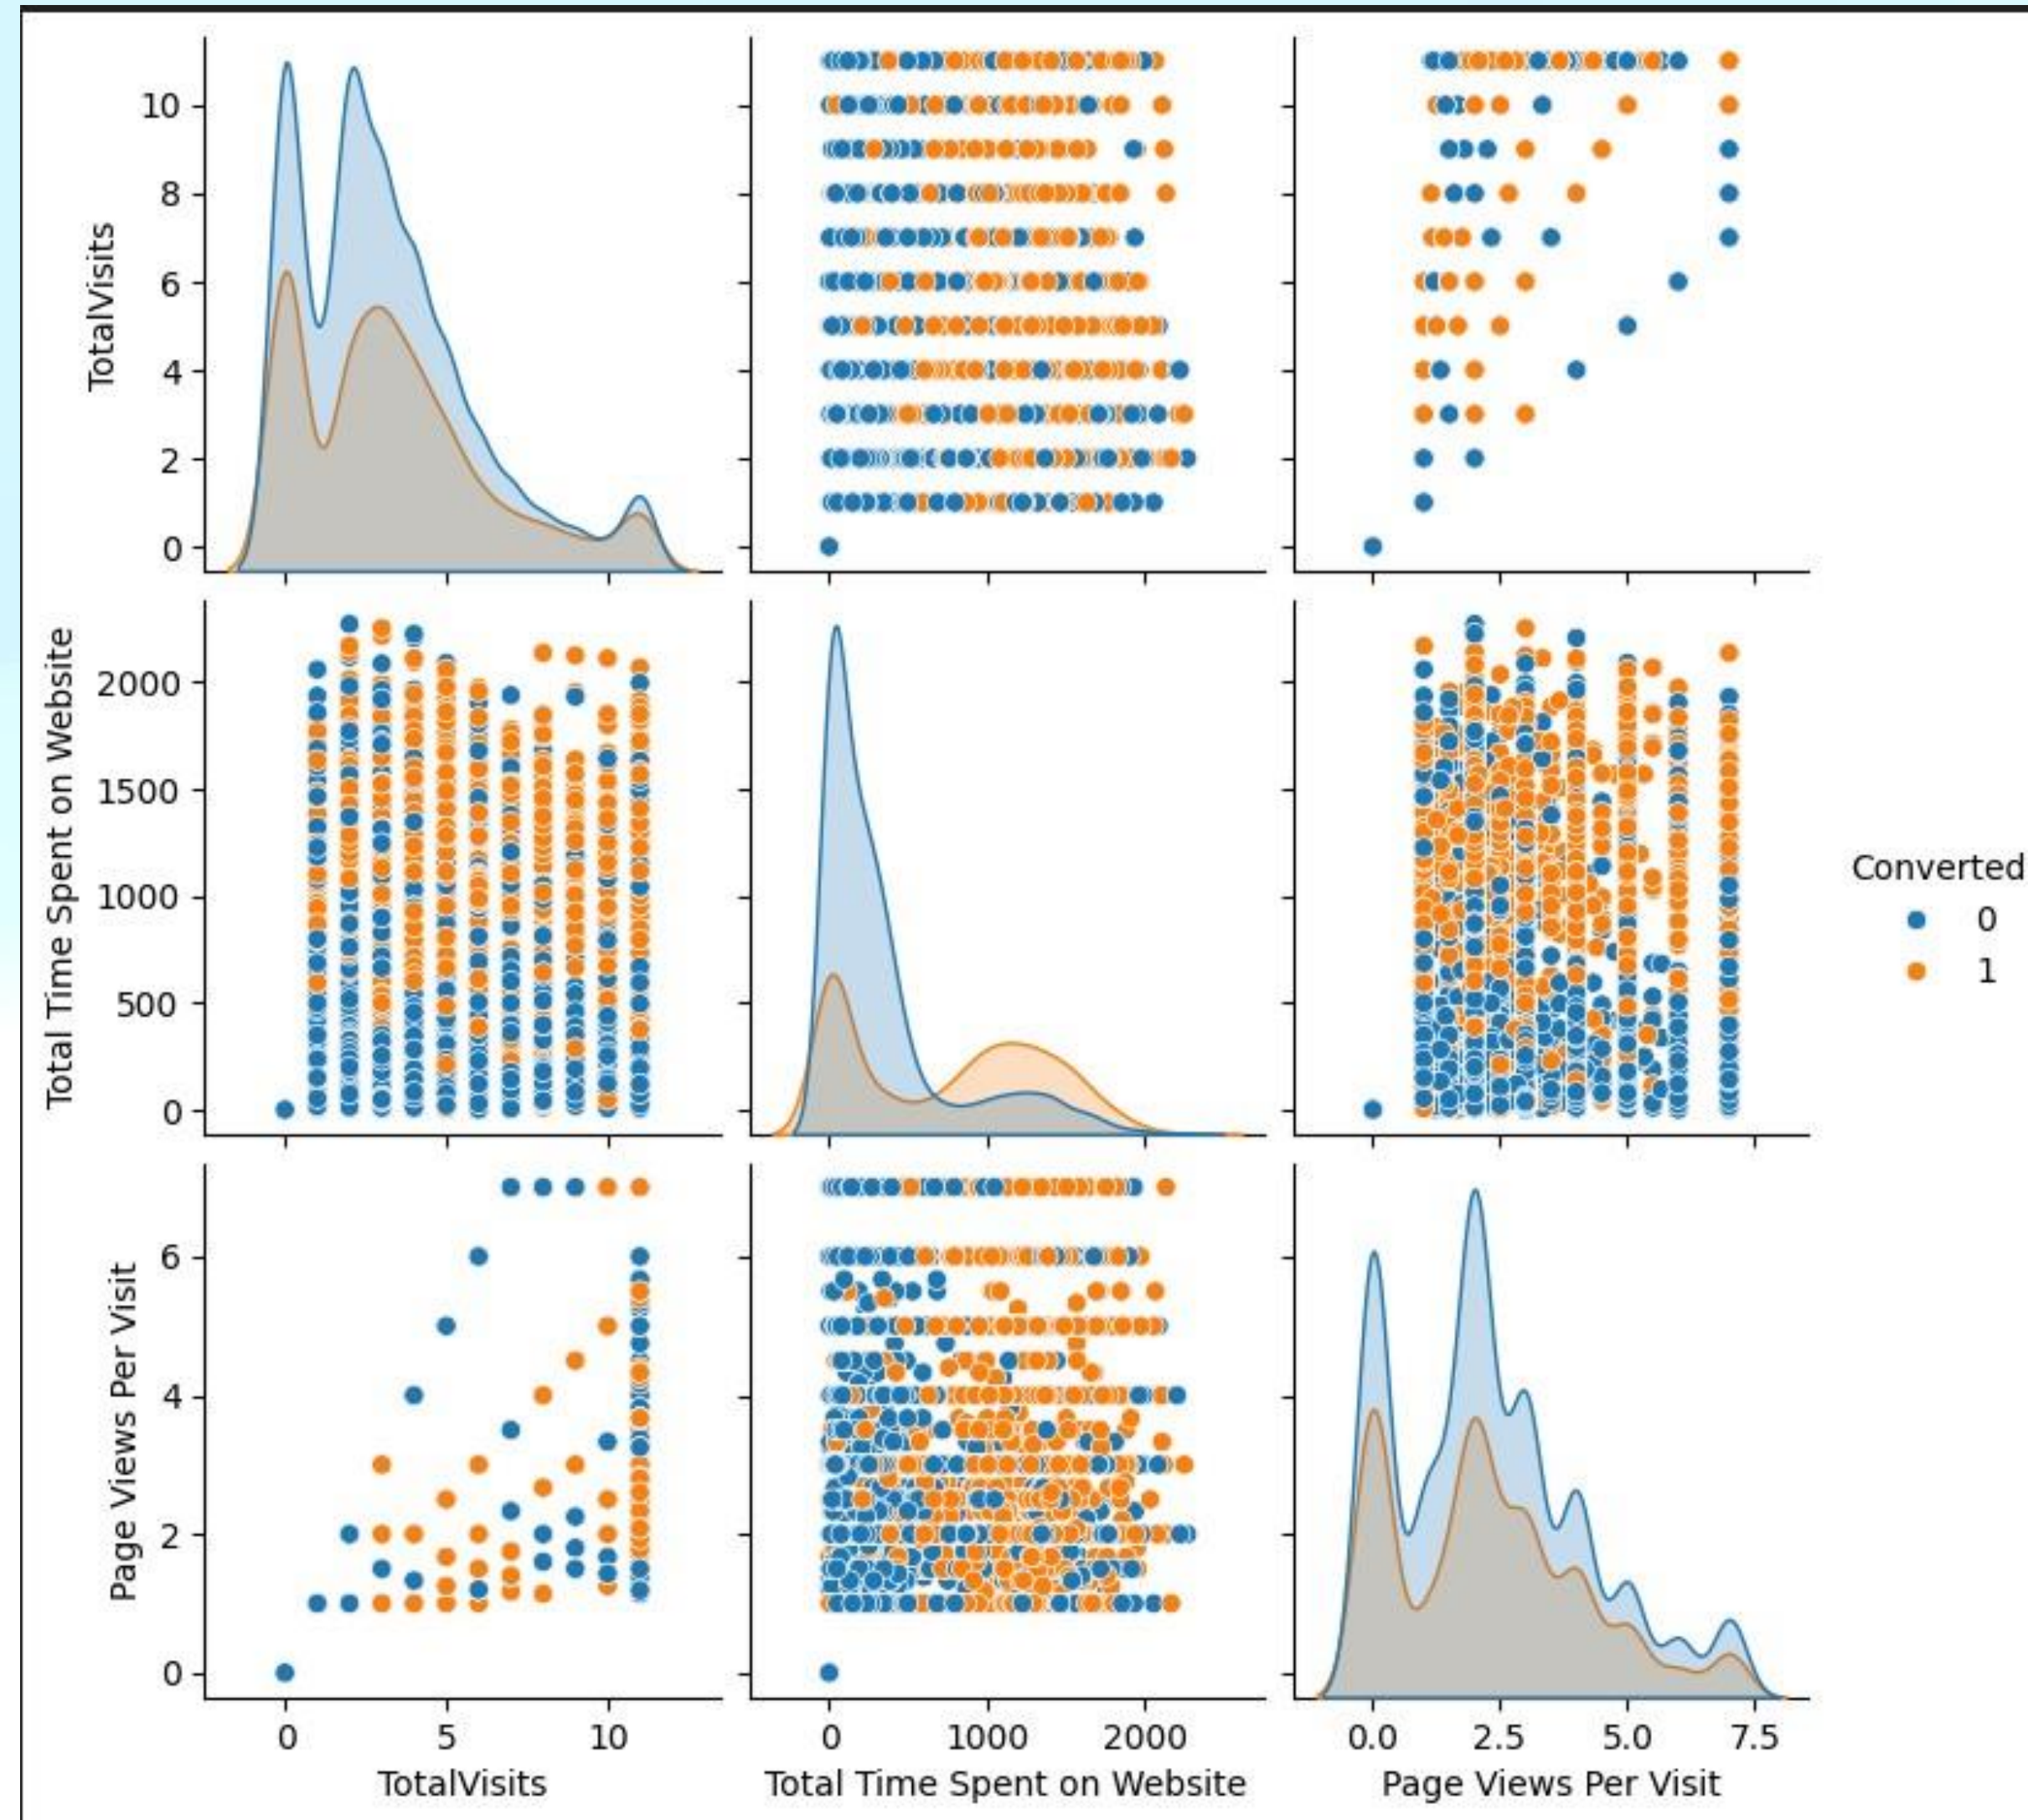

## Correlation Matrix:

Time spent on website have a good +ve correlation with conversion. Total visits and Page views per visit have high correlation. We might need to drop them after checking multicollinearity.

# Data Analysis

Unable to observe  
any useful patterns  
in pair plot of  
continuous  
variables.

# Modeling

From coef column,  
we can identify the  
influence of each  
feature used in the  
model

	coef	std err	z	P> z	[0.025	0.975]
const	-2.2204	0.102	-21.756	0.000	-2.420	-2.020

12	what_is_your_current_occupation__working_profe...	2.27
14	tags__ringing	2.27
5	lead_source__olark_chat	2.16
8	last_activity__other	1.76
4	lead_origin__other	1.46
7	last_activity__olark_chat_conversation	1.43
2	total_time_spent_on_website	1.38
16	last_notable_activity__other	1.38
10	what_is_your_current_occupation__other	1.34
6	do_not_email__yes	1.14

# Modeling

Around 0.33 we get an intersection. We'll be using this point as the threshold.

# Precision Recall

# Evaluation

> Training model  
evaluation matrix  
> In test set we are  
able to achieve

\* Accuracy 0.9

\* Specificity 0.9

\* Sensitivity 0.9

	threshold	accuracy	sensitivity	specificity	precision	recall
1	0.1	0.77	0.96	0.65	0.63	0.96
2	0.2	0.87	0.92	0.83	0.77	0.92
3	0.3	0.89	0.90	0.88	0.82	0.90
4	0.4	0.89	0.87	0.91	0.86	0.87
5	0.5	0.89	0.81	0.94	0.90	0.81
6	0.6	0.89	0.79	0.96	0.92	0.79
7	0.7	0.88	0.74	0.97	0.94	0.74
8	0.8	0.87	0.69	0.98	0.96	0.69
9	0.9	0.84	0.60	0.99	0.98	0.60

# Conclusion

- > We created a logistic regression model with 17 features**
- > We were able to get a specificity of 0.9 and sensitivity of 0.9 in the test set created.**
- > We can change the threshold value to get more sensitivity of specificity according to the requirement.**
